

How to sequence the sessions with flat load in a better way ?

Hi All,

This is a simple method to sequence the sessions in a workflow which is of flat loading (Without any transformation or all sessions having same transformations).

Input: The table name and average/maximum record count as input.

Output: The macro will calculate the number of levels and no of sessions in each level to have optimum load time.

Find the macro here <https://drive.google.com/file/d/0B97Vr-6tYsyTOXgwU1J6M2NWdDA/edit?usp=sharing>

Note: This macro wont consider the table size in terms of number of columns and also consider this as a non-professional code. Can expect some errors.

Thanks,
Shibin Varghese
